L13 ANSWER 1 OF 5 CAPLUS COPYRIGHT 2008 ACS on STN
TI Preparation of monosaccharide- and oligosaccharide-containing gadolinium compounds and contrast medium for MRI
GI

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB Gadolinium compds. represented by the following general formula (I) [R = (G1-NHCH2CH2)2N, [(G2-NHCH2CH2)2NCOCH2CH2OCH2]3C; G1 or G2 represents a residue formed by reacting a sugar lactone with an amino group, the sugar of the sugar lactone representing allose, altrose, mannose, gulose, idose, galactose, talose, ribose, arabinose, xylose, lyxose, erythrose, threose, cellobiose, maltose, lactose, or maltotriose], are prepared The novel gadolinium compds. (1) have a high spin-lattice relaxation (T1) property and can form an image with high sensitivity even when administered in a small amount, (2) are highly effective in imaging systemic blood vessels and the liver, (3) are highly effective in imaging the pancreas, and (4) have such safety that most of the compound is discharged from the body within 24 h. There is also provided a MRI contrast medium containing the compound I. Thus, ring-opening amidation of allonolactone with diethylenetriamine in DMF at room temperature followed by N-protection with di(tert-butyl) dicarbonate

in DMF, acetylation of the sugar moiety with acetic anhydride in pyridine, and removing the Boc group with CF3CO2H in CH2C12 at room temperature gave the amide (Q3-H; R1 = Ac) which underwent amidation with 2-[N,N-bis[2-(2,6-dioxomorpholin-4-yl)ethyl]amino]acetic acid (DTPA dianhydride) in DMF to give the amide (II; R1 = Ac). II was heated with Gd2O3 in H2O at 100° followed by treatment with 1 M aqueous NaOH solution at 40° to give allonamide-containing DTPA-gadolinium complex I (R = Q3; R1 = H) which showed 1/T1 of 40.5 s-1.

TI Toward Iron Sensors: Bioinspired Tripods Based on Fluorescent Phenol-oxazoline Coordination Sites
AB In the quest for fast throughput metal biosensors, it would be of interest to prepare fluorophoric ligands with surface-adhesive moieties. Biomimetic analogs to microbial siderophores possessing such ligands offer attractive model compds. and new opportunities to meet this challenge. The design, synthesis, and physicochem. characterization of biomimetic analogs of microbial siderophores from Paracoccus denitrificans and from the Vibrio genus are described. The (4S,5S)-2-(2-hydroxyphenyl)-5-methyl-4,5-dihydro-1,3-oxazole-4-carbonyl group (La), noted here as an HPO unit, was selected for its potential dual properties, serving as a selective iron(III) binder and simultaneously as a fluorophore. Three tripodal sym. analogs cis-Lb, cis-Lc, and trans-Lc, which mainly differ in the length of the spacers between the central carbon anchor and the ligating sites, were synthesized. These ferric-carriers were built from a tetrahedral carbon as an anchor, sym. extended by three converging iron-binding chains, each bearing a terminal HPO. The fourth chain could contain a surface-adhesive function (Lc). A combination of absorption and emission spectrophotometry, potentiometry, electrospray mass spectrometry, and electrochem. was used to fully characterize the corresponding ferric complexes and to determine their stability. The quenching mechanism is consistent with an intramol. static process and is more efficient for the analog with longer arms. Detection limits in the low nanogram per mL range, comparable with the best chemosensors based on natural peptide siderophores, have been determined These results clearly demonstrate that these tris(phenol-oxazoline) ligands in a tripodal arrangement firmly bind iron(III). Due to their fluorescent properties, the coordination event can be easily monitored, while the fourth arm is available for surface-adhesive moieties. The tripodal system is therefore an ideal candidate for integration with solid-state materials for the development of chip-based devices and anal. methodologies.

TI Solution phase biopolymer synthesis of oligodeoxyribonucleotides using multifunctional liquid phase carriers
AB Multifunctional liquid phase carriers (LPCs) and methods of using LPCs for the preparation of biopolymers are provided. The LPCs are highly sym. compds. that possess more than two points of attachment for biopolymer synthesis. The LPCs have the formula Sp(X1)n, where Sp is a highly sym. moiety such that all X1 groups are equivalent X1 is a functional group that is suitable for biopolymer synthesis, including OH, SH, NH2, COOH and the like. Biopolymers that may be produced using the methods provided include oligonucleotides, peptides, protein nucleic acids (PNAs) and oligosaccharides. Analogs of the biopolymers may also be prepared using the methods. Thus decamer d(GACCGGCAGT) was prepared using multifunctional liquid phase carriers.

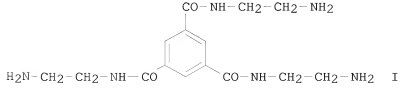
TI Synthesis of new liquid phase carriers for use in large scale oligodeoxyribonucleotide synthesis in solution
GI



I

AB The synthesis of multifunctional sym. primary amines, e.g. I, and the covalent binding of 5'-O-dimethoxytrityl-deoxynucleoside derivs. to their amino groups is described. Different strategies for dedimethoxytritylation including the use of strong acidic ion exchangers or protic acids and modified silica gels and/or gel permeation chromatog. are developed. The resulting liquid phase carriers are suitable for large scale oligodeoxyribonucleotide synthesis in solution using phosphoramidites and gel permeation chromatog. for fast isolation of intermediates.

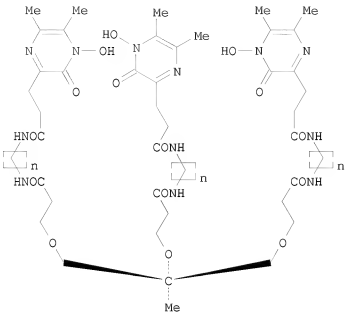
TI N-hydroxyamide-containing heterocycles. Part 5. Synthesis of novel hexadentate ligands composed of N-hydroxy-2(1H)-pyrazinone, aliphatic diamine, and 1,1,1-tris(carboxyethoxymethyl)ethane, and properties of their ferric complexes
GI



I

AB Novel hexadentate ligands I (n = 2, 4, 5, 6), containing N-hydroxy-2(1H)-pyrazinone connected to tricarboxylic acid by an aliphatic diamine through amide bonds were synthesized. UV-visible spectra of the 1:1 M mixts. of I and ferric ion in aqueous solution and the mole ratio plot strongly supported the formation of intramol. 1:1 ferric complexes. The relative stability consts. (log K 20.6-21.7) of the complexes were affected by the spacer length in a mol. Further, I showed higher Fe removal efficiency toward human transferrin than naturally occurring siderophore, desferrioxamine B.
